

# irisMDi Operation

## System Overview

The irisMDi will auto detect whether the incoming video is SDI or HDI and switch into the appropriate mode. The LED on the front panel of the unit will illuminate orange during transition and will be solid green when stable.

To check which mode the unit is in press the 'info' button on the front panel and the LED will flash green....

If the unit is in HD mode (1080 or 720p) then the top left display will show EMW3HB.

If the unit is in SD mode (PAL or NTSC) then the top left display will show EMW3SB.

....to return from this mode press the 'info' button again and the LED will illuminate solid green.

The unit has separate memories for HD and SD. The correct set of memories will be selected dependant on the incoming video.

Use the relevant attached user manual when the mode is HD. In SD the menus will be very similar with the only changes being in parameter specific to SD.
