

irisOBMDi Operation

System Overview

The irisOBMDi will auto detect whether the incoming video is SDI or HDI and switch into the appropriate mode. The LED on the front of the 19 inch rack unit will illuminate orange during transition and will be solid green when stable. This should take approx 5 seconds after changing video standard.

After a video standard change has been made the operator should setup a transition using the VP-10 and then perform it using either the take button or T-bar on the VP-10. This will verify the correct setup conditions so that all subsequent transitions will then perform correctly.

Use the relevant attached user manual when the mode is HD. In SD the menus will be very similar with the only changes being in parameter specific to SD.
